

Top 3 Reasons to Modernize Your Security with Prisma Access

“Digital business and edge computing have inverted access requirements, with more users, devices, applications, services and data located outside of an enterprise than inside.... Security and risk management leaders need a converged cloud-delivered secure access service edge to address this shift.” - Gartner¹

The way we work has changed for good. Your organization’s cloud transformation was already changing the way users accessed applications and how they were secured. Then, seemingly overnight, the COVID-19 pandemic forced you to enable your employees to work remotely.

The pandemic is also accelerating digital transformation, requiring IT and cybersecurity teams to keep essential infrastructure and resources available and secure. Today, you must be able to provide secure access, protect your users and applications, and control data from anywhere.

1. MacDonald, Neil, Lawrence Orans, and Joe Skorupa, “The Future of Network Security Is in the Cloud,” Gartner, 30 August 2019.

Prisma® Access is a cloud-delivered secure access service edge (SASE) that transforms networking and security to help provide secure remote access for mobile users. Prisma Access serves as a virtual service edge regardless of the devices your users are connecting from or where the users—as well as the applications or data centers they are accessing—are located.

Here are the top three reasons you should consider modernizing your infrastructure with Prisma Access:

1. On-demand scalability

Reduce the complexity of securing your remote workers and mobile users.

Prisma Access is built on a global, high-performance network to ensure infinite secure remote access scalability. You maintain the benefit of your existing firewalls with the infinite scale of the cloud, built on the combined infrastructure of Amazon Web Services (AWS®) and Google Cloud. Best of all, there is no need to add to or replace your existing infrastructure.

2. The same security you trust

Extend all the capabilities of your Palo Alto Networks NGFWs to your mobile workforce.

Prisma Access has all the capabilities of our Next-Generation Firewalls, built for the cloud and running on PAN-OS®. It provides Layer 3–7 single-pass inspection of all web and non-web network traffic for malware signatures, intrusion behaviors, and indicators of data loss.

Using GlobalProtect™ network security for endpoints, Prisma Access performs continuous trust assessment of mobile users after they connect to an application or service.

3. Seamless migration

Maximize your existing security investments. Seamlessly migrate your existing firewall policies to the cloud with minimal configuration.

Prisma Access gives you a simplified, seamless way to migrate your NGFW policies to a secure remote access as a service, managed through Panorama™ network security management. You can use all your existing security policies and deployed GlobalProtect agents.

Your existing investments in training security analysts and engineers all apply to Prisma Access, and you can complete migration in just a few clicks.

Prisma Access Migration Program

To facilitate your move to Prisma Access SASE, we're offering our GlobalProtect customers:

1. **Trade-in credit** for the remainder of your paid GlobalProtect subscription
2. **Six more months free** when you buy a three-year Prisma Access subscription
3. **US\$9,000 discount** to put toward your product migration

Contact your account representative for details. This program is active through July 31, 2021.

SECaaS, VPNs, and other secure remote access solutions offer scalability, but they compromise on security. Point solutions like SWGs and CASBs only protect specific resources, requiring you to purchase multiple tools with multiple interfaces.

Prisma Access is a single cloud-delivered service to which all your users and remote locations can connect. It provides all the network management and security you need in a single solution for consistency and simplicity. Prisma Access offers mobile user scalability for the short- and medium-term surge in remote work, along with the ability to modernize your infrastructure in the long term.

Prisma Access is the industry's leading cloud-delivered network security.
